

The Character Match Quiz

Problem Statement

Olivia challenges her friend Ethan to a character matching quiz. Olivia provides Ethan with two strings and asks him to identify which characters from the first string also appear in the second string—**only if** both strings have the same length. For every matching character, Ethan must count how many times it appears in each string and then print the character along with its total frequency across both strings.

Constraints

- If the two strings have different lengths, display:

<string1> and <string2> have different lengths

- If there are no common characters (despite equal length), display:

<string1> and <string2> have no matching characters

- Matching is case-sensitive ($A \neq a$).
-

Input/Output Format

1. Prompt the user:
Enter the first string:
 2. Read the first string (string1).
 3. Prompt the user:
Enter the second string:
 4. Read the second string (string2).
 5. Based on the rules above, print the appropriate message or the list of matching characters with frequencies.
-

Sample Input and Output 1

Enter the first string:

lemon

Enter the second string:

melon

Matching characters and their combined frequency:

l - 2

e - 2

m - 2

o - 2

n - 2

Sample Input and Output 2

Enter the first string:

lemon

Enter the second string:

banana

lemon and banana have different lengths

Sample Input and Output 3

Enter the first string:

grape

Enter the second string:

spice

grape and spice have no matching characters
